Safety Guidelines
This manual contains notices which you should observe to ensure your own personal safety as well as to avoid property damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring to property damage only have no safety alert symbol.

Danger
indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

Warning
indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

Caution
used with the safety alert symbol indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

Caution
used without safety alert symbol indicates a potentially hazardous situation which, if not avoided, may result in property damage.

Notice
used without the safety alert symbol indicates a potential situation which, if not avoided, may result in an undesirable result or state.

When several danger levels apply, the notices of the highest level (lower number) are always displayed. If a notice refers to personal damages with the safety alert symbol, then another notice may be added warning of property damage.

Qualified Personnel
The device/system may only be set up and operated in conjunction with this documentation. Only qualified personnel should be allowed to install and work on the equipment. Qualified persons are defined as persons who are authorized to commission, to earth, and to tag circuits, equipment and systems in accordance with established safety practices and standards.
Intended Use

Please note the following:

Warning

This device and its components may only be used for the applications described in the catalog or technical description, and only in connection with devices or components from other manufacturers approved or recommended by Siemens.

This product can only function correctly and safely if it is transported, stored, set up and installed correctly, and operated and maintained as recommended.

Trademarks

All designations marked with ® are registered trademarks of Siemens AG. Other designations in this documentation might be trademarks which, if used by third parties for their purposes, might infringe upon the rights of the proprietors.

1 Welcome
Welcome to WinCC flexible “Getting Started - First Time Users”. Using an example of a fruit juice mixing system, this manual will illustrate how easy it is to create the user interface for an HMI device using WinCC flexible.

The fruit juice mixing system produces juice, nectar and beverage drinks in the flavors orange, apple and tropical. The necessary ingredients are available in four supply tanks.

The ingredients are mixed in mixing tanks and then filled.

The fruit juice mixing system is operated by means of a small HMI device connected to it. The fruit juice mixing system operator can perform the following tasks:

• Control the fill level in the supply tanks
• Monitor the status of the supply line valves
• Enter and transfer mixture ratios

In order that the operator can perform these tasks, the HMI device must be “configured.” The configuration steps necessary to do this are explained in the “Getting Started - First Time Users manual”:

• Creating a project
• Creating the screens
• Configuring the alarms
• Creating the recipes
• Adding screen changes
• Testing and simulating the project
• Transferring the project (option)

“Configuring” relates to the creation and configuration of the user interface for an HMI device.
The WinCC flexible CD-ROM enclosed contains programs with which you can complete these configuration steps. In addition, install the WinCC flexible edition “Compact”, “Standard” or “Advanced” on your configuration computer.

The following components are used for the example in this Getting Started - First Time Users manual:

![Diagram]

Only the configuration computer is required for the configuration steps mentioned. If the project is to be transferred to an HMI device, the OP 77B device or another HMI device from the 170 series is required.

If an HMI device with different functionality is used, the configuration steps necessary may deviate from the steps explained.
2 Creating a project
2.1 What is a project?

The basis for configuring the user interface is the project. Create and configure all the objects in the project which are necessary to operate and monitor the fruit juice mixing system, e.g.

- Screens, to depict and operate the fruit juice mixing system.
- Tags, to transfer data between the HMI device and fruit juice mixing system.
- Alarms, to indicate the operating status of the fruit juice mixing system on the HMI device.
2.2 Creating the “OP77B_Mixing” project

Creating the “OP77B_Mixing” project

1. Start WinCC flexible:

The WinCC flexible project wizard opens. The project wizard provides support when creating a project by guiding users step-by-step through the configuration settings. The project wizard has various scenarios for frequently required configurations. Complete the configuration settings by selecting the scenarios provided.

2. Create a new project.
3. To operate the fruit juice mixing system, only one HMI device and one control unit are needed. Therefore, select “Small Machine”: 

![Diagram showing project selection]

WinCC flexible Getting Started First Time User
Getting Started, Edition 04/2006, 6ZB5370-1CL02-0BA2
4. Select the “OP 77B” HMI device. Use the predefined “SIMATIC S7 300/400” as controller:

5. Click on “Next” to apply the standard settings provided on the pages “Screen Templates.”

6. Click on “Next” to apply the standard settings provided on the “Libraries” pages.
7. Then enter information on the project:
2.3 New “OP77B_Mixing” project

The project wizard creates the new project according to the information specified and opens it in WinCC flexible. To the left is the tree structure that contains all the configurable elements:

Projects are edited in the Work Area. All WinCC flexible elements are arranged on the borders of the work area. With the exception of the work area, you can organize, configure and, for example, move or hide any of the elements to suit your individual requirements.

All component parts and all available editors of a project appear in a tree structure and can be opened from there in the Project View. Furthermore, in the Project View you have access to the project properties as well as the device settings of the HMI device.

The Property View is used to edit object properties, e.g. the color of screen objects. The property view is only available in specific editors.
The Toolbox contains a selection of objects that you can add to your screens, e.g. image objects or operator control elements. In addition, the toolbox also provides libraries containing object templates and collections of faceplates.

The project wizard has already created some elements:

**Screens**

Some pre-configured screens and the templates are stored in the “Screens” area.

The start screen for the OP 77B HMI device is automatically opened in the workbench area to the right of the root structure. The Start screen contains two alarm windows positioned one above the other (Error Alarm Window and System Alarm Window) which are required for later operation of the HMI device for the fruit juice mixing machine. The gray shading of the Alarm Window indicates that this alarm window is inserted in the template.

You do not need the pre-configured screens for the following configuration steps. Therefore, delete all screens with the exception of the “Start screen”:
2 Creating a project

Connections
In addition, the connection settings between the HMI device and controller have already been defined.
Customizing the template

Objects inserted in the template are those which should appear in every screen, e.g. the previously mentioned alarm windows.

Since the alarm windows only appear when a message occurs while the fruit juice mixing machine is in operation, the display of the alarm windows can be suppressed during configuration. To do this, deactivate the level in which the alarm windows are inserted.

1. Open the template:
2. Set the active layer to "0" (2), deactivate the layer with the three alarm windows (3) and close the template (4):
Setting up the workbench area

The WinCC flexible Workbench consists of individual windows which can be arranged as required around the work area. The following section describes how to “dock” the Object view in the Project view.

1. Unhide the Object view (1) and configure the view so that it is not automatically hidden (2):

“Docking” refers to the integration of a window into the WinCC flexible workbench. You can automatically hide docked frames in order to increase your workspace.
2. Docking the Object view in the Project view:
The Object view contains the contents of the area selected in the Project view, e.g. Screens.
Resetting window arrangement

The docking of windows at the correct position requires a little practice. For this reason, the arrangement of the windows can be reset to their original setting at any time:
Interrupting configuration

In order to interrupt work on the configuration, e.g. to continue it on the next day, save the project. When saved for the first time, the user is prompted to enter a name for the project:
The next time WinCC is started, the project is displayed in the project wizard:
3 Creating the screens
3.1 What is a screen?

Screens are the main elements of a project. They enable the fruit juice mixing system to be operated and monitored, e.g. the display of fill levels or the selection and transfer of mixture ratios.

Screens contain objects such as output fields, text fields and display fields with which fill levels can be displayed.

The user interface of the fruit juice mixing system is comprised of four screens. The following section explains the configuration of the fill level indicators for water, concentrated juice, sugar and flavoring. The fill levels should be indicated on the HMI device both graphically and numerically.
3.2 Configuring fill level displays

The following objects are required to configure the fill level displays:

- Tags to store the fill levels
- Output fields for displaying fill levels in numeric form
- Bar graphs for displaying fill levels graphically
- Text fields for labeling

Creating fill level tags

1. Create a tag which stores the fill level of the water:

2. Configuring the tag:

   The tags store the tank fill levels which are determined by measuring transmitters. The data is transferred between the controller and HMI device via the communication connection.
3. Use the same procedures to create the “FillLevel_Consentrate”, “FillLevel_Sugar” and “FillLevel_Aroma” tags:

Creating an output field for numeric fill level display

1. Create a new screen:
2. Enter “FillLevels” as the new name:
3 Insert an IO field in the screen in which the water fill level can be displayed:

4. Configure the output format of the IO field in the Properties view:
5. Resize the IO field:

Creating a bar graph for displaying the fill level graphically

1. Insert a bar in the screen:
2. Configure the bar graph in the Properties view:
   - Enter the volume of the tank (1) and select the “FillLevel_Water” tag (2, 3):
   - Adapt the size (1) and align the bar to the right (2, 3):
   - Deactivating the scale indicator
Creating a text field to label the fill level display
1. Insert a text field in the screen:

2. Enter a “W” for water in the Properties view:

3. In the same way, create another text field labeled “l” for liters.

Arranging the text fields, bar graphs and output field.
1. Position the two text fields, bar graphs and IO field in the display:
Adding the fill level displays for juice, sugar and flavoring

1. In the same way, create the fill level displays for juice, sugar and flavoring:

   The fill level display is configured. When the system is running, the operator can read the current fill levels of the tanks on the HMI device.
4 Configuring the alarms
4.1 What is an alarm?
Alarms indicate events or operating states which occur or prevail in the fruit juice mixing system. Alarms can be used, for example, for diagnostics purposes when clearing faults. Alarms are differentiated as follows:

- **Discrete alarms** indicate changes of status in the fruit juice mixing system and are triggered by the controller. They indicate, for example, whether a valve is open or closed.

- **Analog alarms** indicate a value has moved outside the limits of the permitted range. An analog alarm is triggered, for example, when the speed of a motor drops below a specific value.
4.2 Configuring discrete alarms

Each tank in the fruit juice mixing system is equipped with an inlet valve. The following section explains how to configure an alarm display in which the states (open or closed) of the inlet valves for water, juice, sugar and flavoring are shown.

When a valve opens or closes during operation, the corresponding discrete alarm is triggered.

Creating tags to store the states

The states of the valves are stored in the “Valve_Status” tags. Each status is assigned a bit in the tag.

- Water valve: Bit 0 and Bit 1
- Juice valve: Bit 2 and Bit 3
- Sugar valve: Bit 4 and Bit 5
- Flavoring valve: Bit 6 and Bit 7

1. Create the “Valve_Status” tag:
2. Configuring the tag:

Creating alarms for status display

1. Create a new discrete message:
2. Create the discrete alarm in the Properties view:
   - Enter "Valve (water) open" (1) and select the alarm class (2, 3):
   - Select the tag in which the status of the valve is stored.
• Select the bit number which represents the “open” status:

When the water tank valve opens, the discrete alarm “Valve (water) open” is triggered.

3. In the same way, configure the discrete alarm “Valve (water) closed.”

4. Configure the discrete alarms for the “juice”, “sugar” and “flavoring” valves:

When you create the second discrete alarm by double-clicking on the empty line, the settings from the first discrete alarm are retained. The alarm number and bit number are automatically incremented.
4.3 Configuring analog alarms

The fruit juice mixing system’s mixing tank is equipped with a mixer whose speed must be monitored. When the speed moves outside the upper or lower limit value, the corresponding alarm should appear on the HMI device.

Creating the tag to store the speed

The speed of the mixer is stored in the “Mixer_Speed” tag.

1. Create the “Mixer_Speed” tag:

2. Configuring the tag:

3. Check that the “Cyclic continuous” acquisition mode is set under General in the Property window.
Creating alarms for speed monitoring

1. Create a new analog alarm:

2. Configure the analog alarm in the Properties view:
   - Enter “Mixer speed too high” (1) as the alarm text and select the alarm class (2, 3):
     Alarms of the “Errors” alarm class must be acknowledged by the operator.
4 Configuring the alarms

- The speed of the mixer is stored in the “Mixer_Speed” tag. Select the “Mixer_Speed” tag:

- Enter “800” as the maximum permissible speed:

- Select “On rising edge”:

3. In the same way, configure the “Mixer speed too low” alarm. The alarm should be triggered when the speed drops below 400 (at “falling edge”).

WinCC flexible Getting Started First Time User
Getting Started, Edition 04/2006, 6ZB5370-1CL02-0BA2
4.4 Configuring an Alarm View

The Error Alarm Window ensures that the user is notified of irregularities during operation. The Error Alarm Window appears in every screen.

The Alarm view shows all the error alarms and warning alarms which have occurred to date. The following section explains how to configure an alarm view to show alarms on the HMI device.

Creating an Alarm View

1. Create a new screen:
2. Enter “Messages” as the new name:
3. Drag the Alarm view into the display:
4. Configure the Alarm view in the Properties view:

- Make selections so that the alarm classes “Warnings” and “Errors” are displayed in the alarm view:

- Make the necessary selections so that the last incoming message is displayed in the first line and the alarm text is displayed with the time.

When the system is in operation, the status of the water, juice, sugar and flavoring valves appear on the HMI device as bar graphs.

The speed deviation of the mixer appears as an alarm together with specification of the time in a separate Alarm window which is configured by default in the template.
5 Creating the recipes
5.1 What is a recipe?

A recipe contains a combination of related production data, such as mixing ratios. A mixing ratio can be transferred from the HMI device to the fruit juice mixing system in a single working step in order, for example, to switch production from orange juice to orange nectar.

The fruit juice mixing system can produce drinks with "orange", "apple" and "tropical" flavors. A recipe is created for each flavor. The ingredients required for each flavor are defined in the recipes.

In turn, each recipe contains three recipe data records in which the mixing ratios for "juice", "nectar" and "beverage" are stored.
5.2 Creating a new recipe

The following section explains how to create the “Orange” recipe together with the associated mixing ratios for juice, nectar and beverage.

Creating a recipe for the “Orange” flavor

1. Create a new recipe:

![Image 1](image1.png)

2. Enter the name and view name for the recipe:

![Image 2](image2.png)
3. Select the path in which the recipe data should be stored on the HMI device.

Creating tags for the quantities of the ingredients

Four tags are required in order to transfer the mixing ratios to the fruit juice mixing system. Each tag contains the quantity of one of the ingredients.

1. Create the “Litre_Water”, “Litre_Concentrate”, “Kilo_Sugar” and “Gram_Aroma” tags with the following settings:
Creating recipe elements for the ingredients

One recipe element is required for each ingredient, in this case water, juice, sugar and flavoring.

1. Create a new “Litre_Water” recipe element:

2. Enter the name and view name for the recipe element:
3. Link the recipe element with the “Litre_Water” variable:

4. Use the same procedures to create the recipe elements “Litre Concentrate”, “Kilo Sugar” and “Gram Aroma”: 

![Image of WinCC flexible interface with recipe elements and links]
5 Creating the recipes

The mixing ratios can also be entered in external programs, such as MS Excel, and imported on the HMI device.

52

Entering mixing ratios

A specific quantity of the ingredients is required for each individual drink “juice”, “nectar” and “beverage.” The mixing ratios are stored in the recipe data records.

1. Create a new "Beverage" recipe data record:

2. Enter the name, view name and number:

3. Enter the quantities of the ingredients:

4. In the same way, create the recipe data records for “Nectar” and “Juice”:

WinCC flexible Getting Started First Time User
Getting Started, Edition 04/2006, 6ZB5370-1CL02-0BA2
5.3 Configuring a Recipe view

The following commands should be available on the HMI device.

- Create recipe data record
- Save recipe data record
- Delete recipe data record
- Transfer recipe data record to fruit juice mixing system
- Read recipe data record from fruit juice mixing system

To do this, a Recipe view is inserted:

1. Create a new screen:
2. Enter “Recipes” as the new name:
3. Drag the Recipe view into the display:
5 Creating the recipes

4. Enable the commands that should be available in the Recipe view.

5. Then define the following view settings:
6 Adding screen changes
6.1 What are screen changes?

The following screens are now configured in the “OP 77B_Mixing” project:

- Fill levels
- Alarm view
- Recipes view

In order to be able to switch between these screens on the HMI device during operation, screen changes can be added. The screen changes are assigned to the <F1> through <F4> softkeys on the HMI device. The <K4> key should be used to switch off the HMI device.
6.2 Adding screen changes

Before assigning screen changes to the softkeys, a Choices screen must be created. The Choices screen shows the operator which key must be used to switch to a specific screen on the HMI device.

Creating a Choices screen to display the softkey assignment

1. Open the “Start Screen” screen:
2. Rename the “Start Screen” screen:
3. Enter “Selection” as the new name:
4. Delete the text field with the screen name in the screen.
5. Create five text fields with the following content:
   - “F1 = Fill level”
   - “F2 = Alarms”
   - “F3 = Recipes”
   - “F4 = Choices”
   - “K4 = Exit”

Define the Start Screen in Device Settings. The project wizard has already registered the Start Screen:
Assigning screen changes to softkeys

1. Open the template:

2. Assign the change to “FillLevels” to softkey <F1>:

   By pressing the <F1> softkey on the HMI device during operation, the screen with the recipe views appears in the display.

3. Assign the changes to “Messages”, “Recipes” and “Selection” to the <F2>, <F3> and <F4> softkeys.
Configuring deactivation of the HMI device

1. Open the "Selection" screen:

2. Assign the “StopRuntime” system function to the <K4> key:

3. Save the project so that the settings take effect.
7 Testing and simulating the project
7.1 Testing a Project

You have just created your first project. Before the configuration is concluded, the project can be tested and simulated using the migration consistency check function and the simulator provided by WinCC.

The migration consistency check ensures that the value ranges are maintained and that invalid entries are indicated, for example.

1. Start the migration consistency check:

The result of the consistency check appears in the Output view:

If no faults or warnings have occurred in the configuration, the "OP 77B Mixing" project can be tested and simulated. If an error occurs, you can jump directly from the context menu to the fault location in the project.
7 Testing and simulating the project

7.2 Simulating the project

The simulation function enables logical configuration errors, e.g. incorrect limit values, to be found.

The following section explains how to simulate the fill level indicator and alarms for the valve status.

Creating a simulation table

1. Start the simulator:

2. Select the “FillLevel_Water” tag and enter the simulation values:
3. Complete the simulation table with the “FillLevel_Concentrate”, “FillLevel_Sugar”, “FillLevel_Aroma”, “Mixer_Speed” and “Valve_Status” tags:

![Simulation Table]

4. Save the simulation table
7 Testing and simulating the project

Simulating the project

1. Start the simulation:

Acknowledge the pending alarms with <ACK>.
2. Change to the “FillLevels” screen and observe how the fill levels change:

![FillLevels Screen]

3. Change to the “Messages” screen and observe how the alarms on the valve status are triggered:

![Messages Screen]
7 Testing and simulating the project

4. Change to the "Recipes" screen and open any recipe data record:

WinCC flexible Getting Started First Time User
Getting Started, Edition 04/2006, 6ZB5370-1CL02-0BA2
8 Transferring the project (option)
The graphic user interface has been created and the tags set up in the project in order to read process values from the controller or to transfer them there. Proceed as follows to do this:

- Check the predefined connection parameters
- Transfer the project to the HMI device

These steps must be carried out when the project is created for an HMI device in the 170 series other than the OP 77B.
8.1 Check connection parameters

The OP 77B HMI device is connected to the fruit juice mixing system’s controller via an MPI network.

1. Open the Connections editor:
When the project was created with the project wizard, connection parameters were already set. Addresses 1 and 2 are defined for the HMI device and controller, respectively. The controller and HMI device communicate with each other via an MPI network:
8.2 Transfer the project to the HMI device

In order that the HMI device can be operated, the S7 PLC must be connected to the HMI device. The control program “S7Mixing” is located on the third WinCC flexible CD in the “Documents\[Language]\Getting Started” folder.

After having checked the connection parameters, transfer the project data to the HMI device:

1. Connect the HMI device to the configuration computer using an MPI cable.

2. Start the transfer:
3. Define the following transfer settings (1, 2) and transfer the project to the HMI device (3):

Screen changes can then be triggered and new recipe data entered on the HMI device.

By transferring the project to the HMI device you have successfully carried out the tasks in “Getting Started - First-Time Users” and created a runnable project.

On the HMI device, you can, e.g. execute the “Simulation” steps again.

If you like, you can now continue with the “Getting Started - Advanced”. In the “Getting Started - Advanced” you use a more powerful HMI device and, by expanding the existing configuration, familiarize yourself with the additional functionalities of WinCC flexible.
8 Transferring the project (option)
